STUDENT HEALTH MANAGEMENT

Your school system wasn't built for this.

Other school platforms are built to manage enrolments, timetables and academic records. Storing sensitive student medical data alongside them creates real risks — for students, for staff, and for your school.

Why medical data needs its own system

The risks of keeping health records inside your school information system (SIS) — and other platforms not built for the job

Overexposure by default

Anyone with school information system (SIS) access can see every student's medical conditions, medications and health plans — regardless of whether they ever interact with that student.

No audit trail for health data

SIS platforms don't record who viewed, edited or exported a student's health information. If something goes wrong, there's no way to trace what happened.

Different compliance obligations

Health records are subject to stricter obligations under Australian privacy and health records legislation than general school administrative data. Mixing them creates a compliance gap.

No fit-for-purpose workflows

SIS platforms can't send medication reminders, log care events with witnesses, generate incident PDFs, or issue guardian permission tokens. Health management requires health-specific tools.

A data breach or inappropriate access to a student's health information carries far greater consequences than a leak of academic records — for the student, the family, and the school.

SIS vs. dedicated health system (SIS = school information system)

Your school info system

- ✗ All staff with SIS access can view all student health data
- ✗ No record of who viewed or changed health information
- ✗ No medication scheduling, reminders or administration logging
- ✗ No guardian health portal or secure permission workflow
- ✗ No incident or care event reports — just free-text notes
- ✗ Health data mixed with academic data in the same breach footprint

mymeddiCAL

- ✓ Role-based access — only staff who need it can see medical data
- ✓ Full audit trail — every view, edit and log is timestamped
- ✓ Medication schedules, care event logging, browser alerts
- ✓ Secure guardian portal with token-based permission workflows
- ✓ Professional PDF reports generated in one tap
- ✓ Health data isolated — separate system, separate breach surface

mymeddiCAL is purpose-built for student health management — not adapted from a platform designed to track attendance and report card grades.

The case for separation

0

SIS platforms with a dedicated health audit trail

100%

of mymeddiCAL access is role-gated and logged

1

platform for all health workflows — not a notes field in your SIS

≠

Medical records and academic records are not the same — they shouldn't live in the same place

”

We had medical notes scattered across our current system's profiles, spreadsheets and sticky notes. mymeddiCAL gave us one place — and the confidence that only the right people could see it.
